

How the work went

The work went well. For this assignment we both watched the udemy tutorial regarding the meal's app on our own. It was time consuming, but insightful. So, we planned that we watched and developed the app on our own before we started with the enhancement. Sander stood for the styling and setting up the project to github as well as writing user stories and class diagram. Together we developed the try your luck functionality. We developed most of it with par programming, but finish touches were made by Daniel since Sander needed to catch a plane. This was fine because the last project Sander was the one contributing the most. The work distribution is never really a problem since we work on a lot of projects together.
